

limescale test

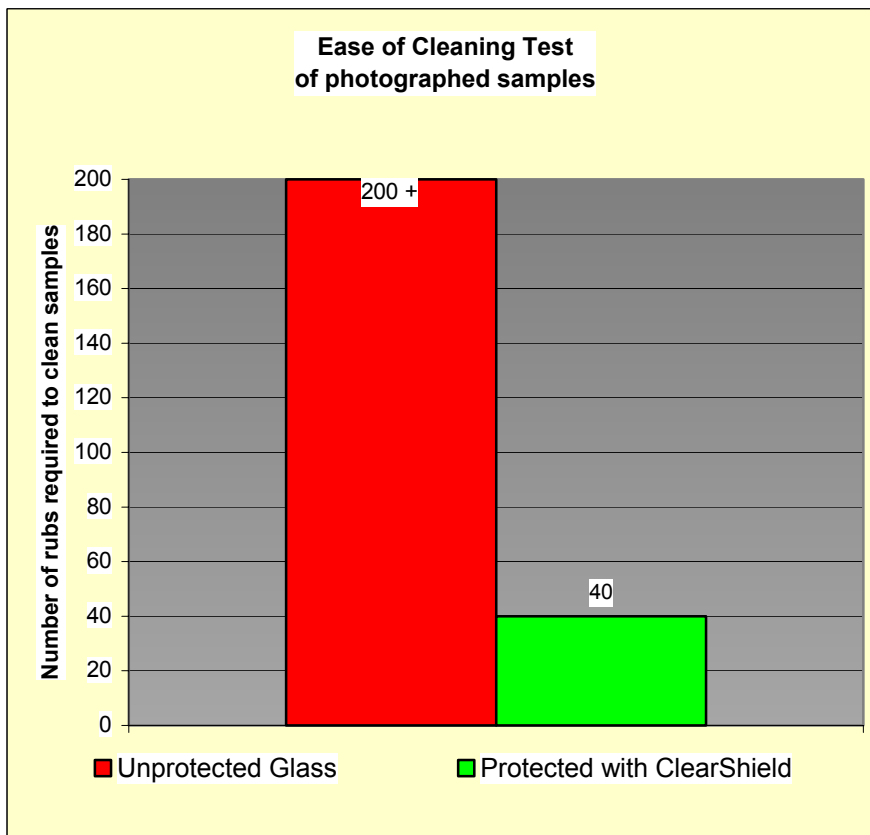

ClearShield is the only glass protection system that has proven its claims through years of actual real life experience.

ClearShield has been providing great satisfaction to many shower manufacturers and their customers worldwide for more over 10 years. Although laboratory tests cannot replicate real life conditions, we want to prove our claims. An experiment was devised that provides strong evidence of the higher resistance in conditions as close as possible to a shower environment.

The white patches and dots are limescale. The sample protected with ClearShield Shower Glass Protect has the least build-up.

Accelerated limescale build-up through submersion in very hard water

Both the unprotected glass and protected glass samples were submersed in very hard water in an accelerated test.

After six days of exposure, 200 rubs were not sufficient to remove the limescale from the unprotected sample.

The easy-clean properties of ClearShield was highlighted in this experiment as only 40 rubs were sufficient to clean the protected sample.
